

Fidelity-shot-cost tradeoff: post-selected vs. dynamic (ibm\ torino, $N_{\text{shots}} = 10,000/\text{basis}$)
 $\rho_{\text{succ}} = 0.2384 \Rightarrow$ dynamic saves $4.19\times$ shots at fidelity cost $\Delta F = 0.0899$ (30 subsamples/point)

(a) Fidelity vs. useful samples

(b) Fidelity vs. total shots fired

(c) Statistical precision
(dashed = $1/\sqrt{N}$ reference)
